Disclosure

I am a consultant for:

- Fresenius Kabi (Advisory for novel pain medication development)
- Abbott Laboratories (New product development, clinician education and training seminars)

No other conflicts or relationships to disclose.

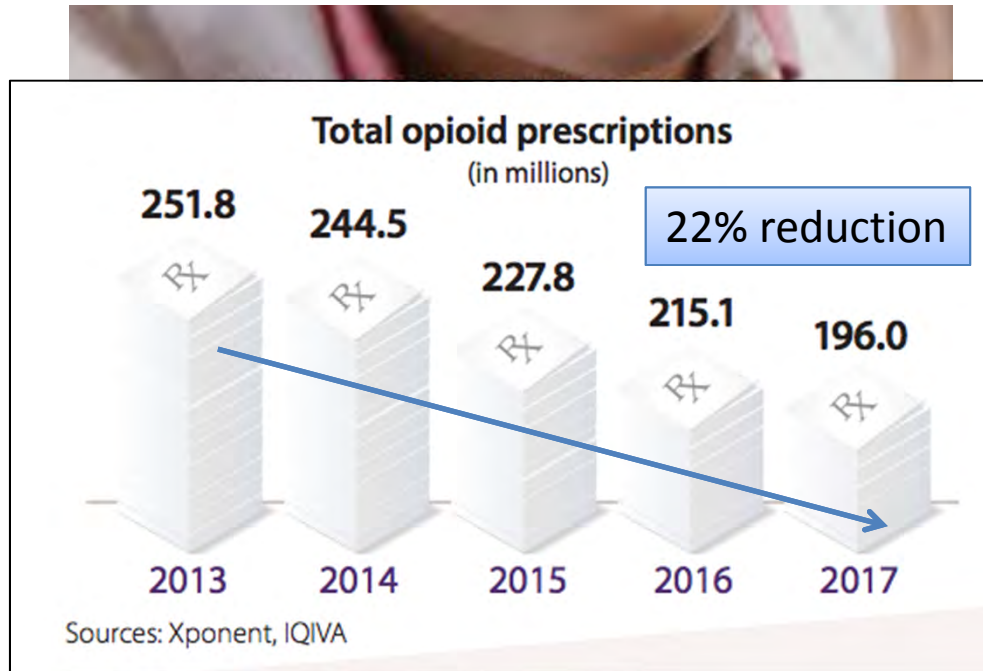

I do not receive royalties or own stock or stock options of any drug or device manufacturer, or health care company

Learning Objectives

At the end of this presentation participants should be able to:

- Define pain care outcomes and contributing factors
- Illustrate the incidence of persistent opioid use after surgery and risk factors
- Identify complications related to preoperative opioid use
- Discuss the above as a need statement for integrative comprehensive pain care

Rates of opioid prescribing

Sources: CDC, Quintiles IMS

AMA opioid task for progress report

All have occurred since publication of the CDC guidelines except for:

1. Reduction in opioid prescriptions
2. Increase in opioid related overdose deaths
3. Increased prescribing of buprenorphine
4. All of the above have occurred

Opioid

3 Waves of the Rise in Opioid Overdose Deaths

Prevalence of pain

- 1.5 billion people live with chronic pain worldwide
- 100 million Americans affected (1 in 3)
- Affects more Americans than diabetes, heart disease, and cancer combined.
 - Silent epidemic

Global Industry Analysts, Inc. Report, January 10, 2011.
American Academy of Pain Medicine

Outcomes in pain care

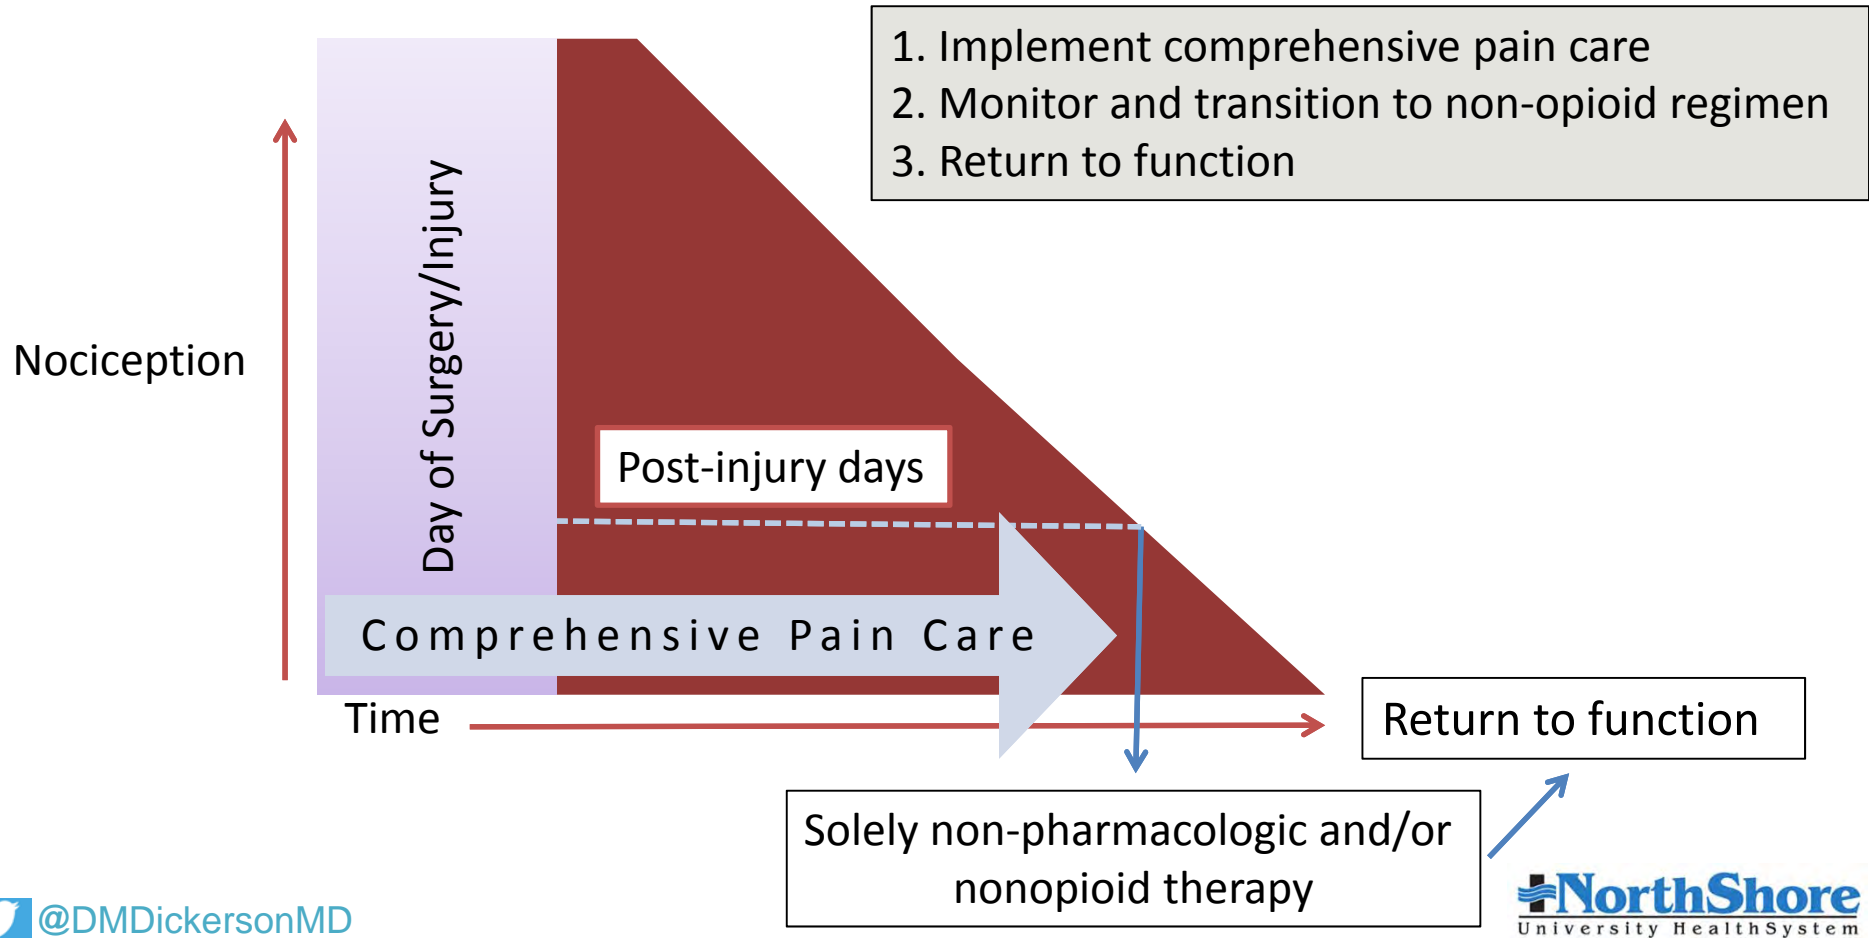

Persistent (chronic) uncontrolled pain

- Suffering, disability, substantial healthcare cost, decreased function (cognitive and physical), decline of total health

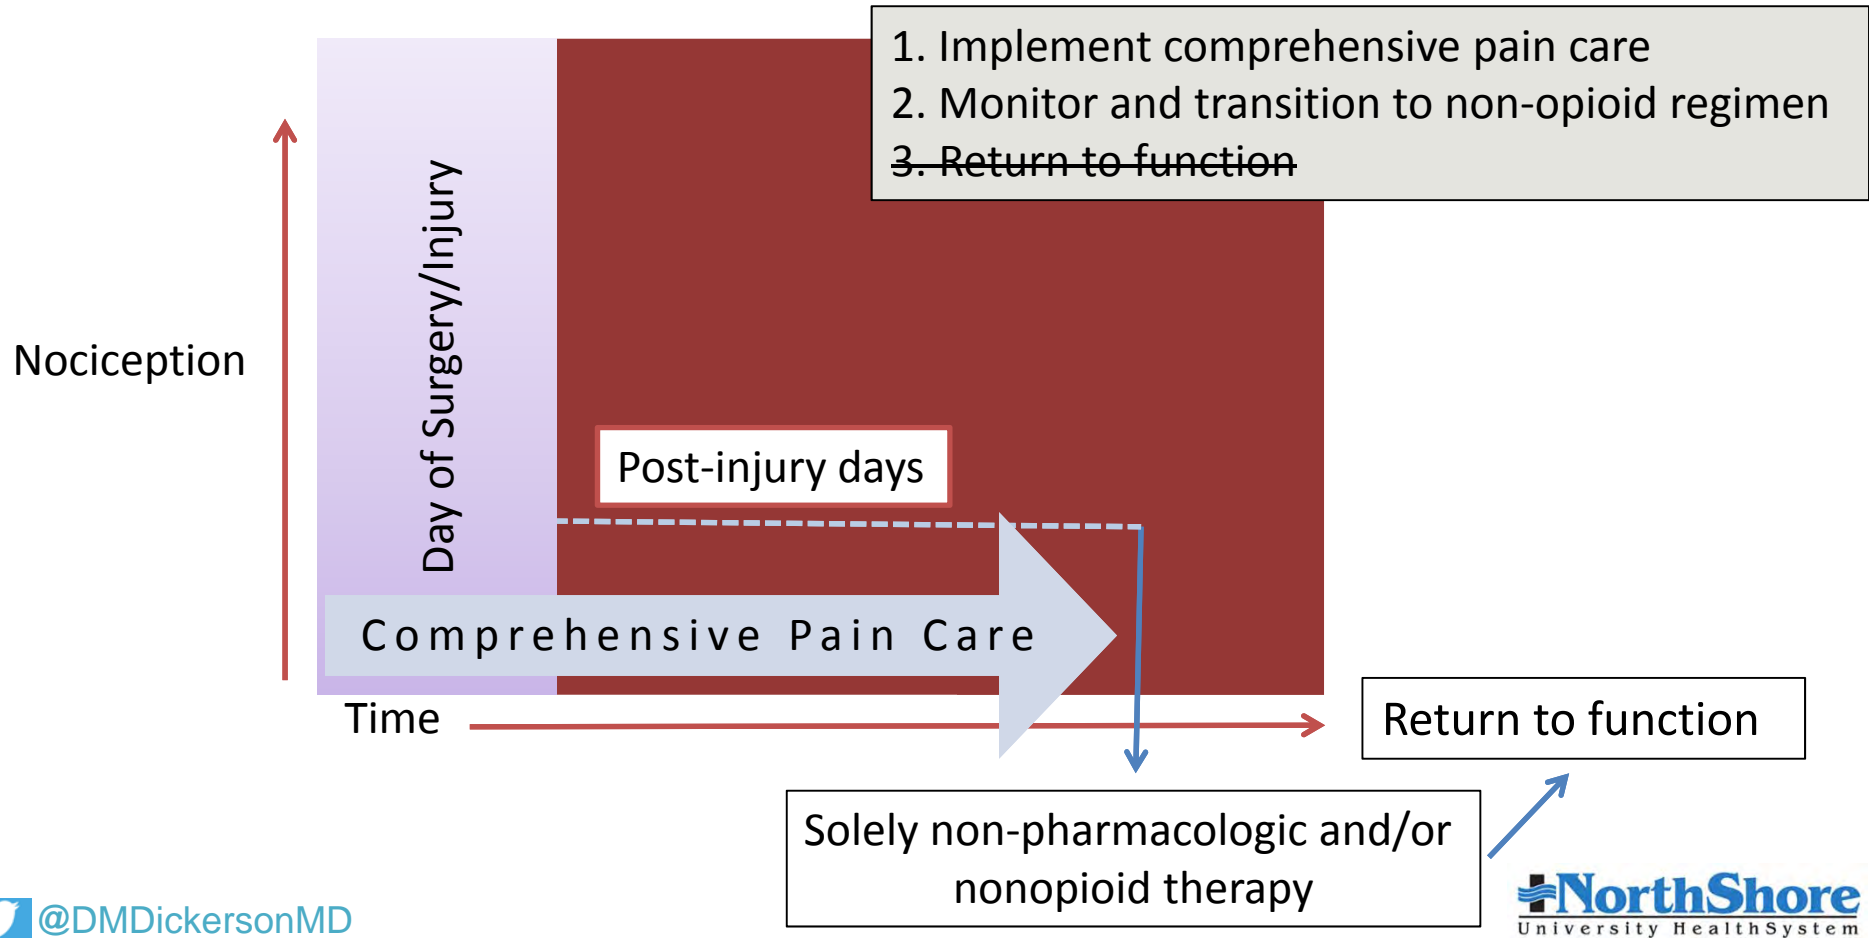

Persistent opioid or analgesic use

- Therapy burden (adverse events, side effects) decline of total health

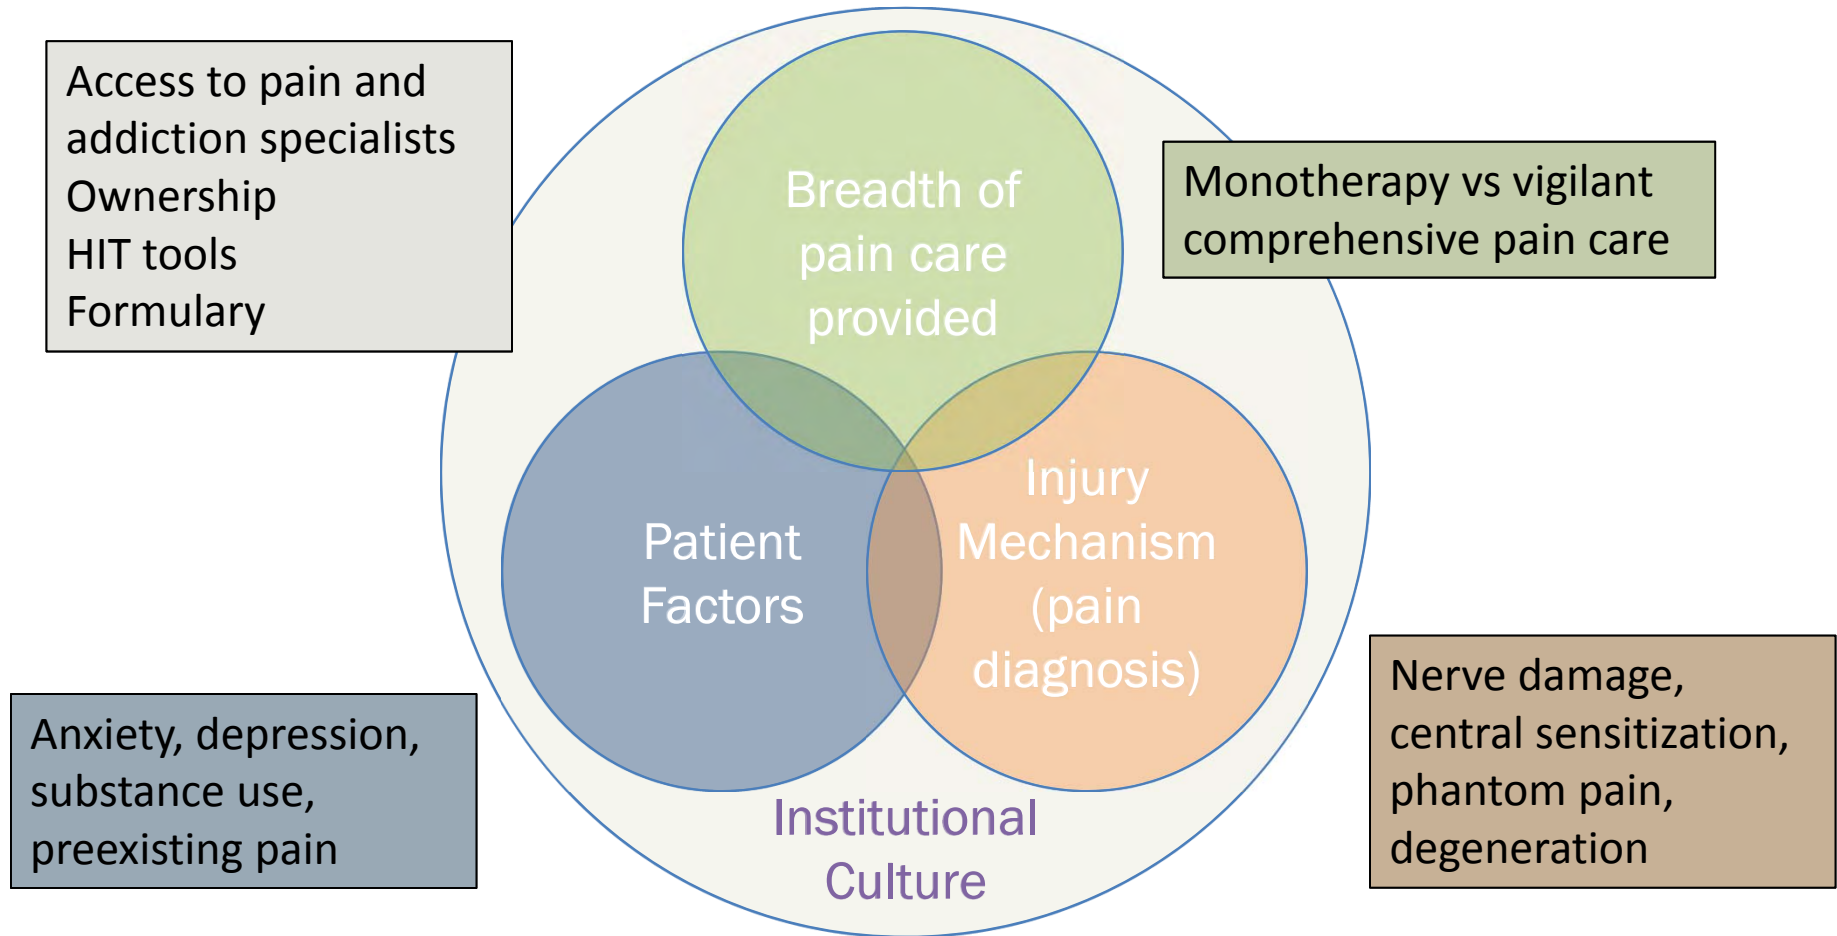

From injury to recovery

From injury to persistent pain

Outcomes in Pain Care: contributing factors

Gateways to persistent opioid use

Surgical opioid Rx: a gateway to dependence?

Access/exposure: 40% of opioids prescribed are for post-operative indications

Surplus: 75% of misused opioids by first time users are from surplus prescriptions

Levy B, Paulozzi L, Mack KA, Jones CM. Trends in Opioid Analgesic–Prescribing Rates by Specialty, U.S., 2007–2012. Am J Prev Med. 2015 Sep 1;49(3):409–13

Persistent opioid use after surgery is associated with:

1. Tobacco use
2. Anxiety and depression
3. Preoperative pain
4. Substance use disorder
5. All of the above

Persistent opioid use after surgery is more likely in:

- A. Major Surgery
- B. Minor Surgery
- C. Similar incidence between the two

JAMA Surgery | **Original Investigation**

New Persistent Opioid Use After Minor and Major Surgical Procedures in US Adults

Chad M. Brummett, MD; Jennifer F. Waljee, MD, MPH, MS; Jenna Goesling, PhD; Stephanie Moser, PhD; Paul Lin, MS; Michael J. Englesbe, MD; Amy S. B. Bohnert, PhD, MHS; Sachin Kheterpal, MD, MBA; Brahmajee K. Nallamothu, MD, MPH

N=36,177 patients, mean age 44.6y, 66% female, 72% white, 80% minor surg, 20% major surg

Primary outcome: *Opioid Rx 90-180 days post surgery*

Results: **5.9 to 6.5%**; Non op control group **0.4%**

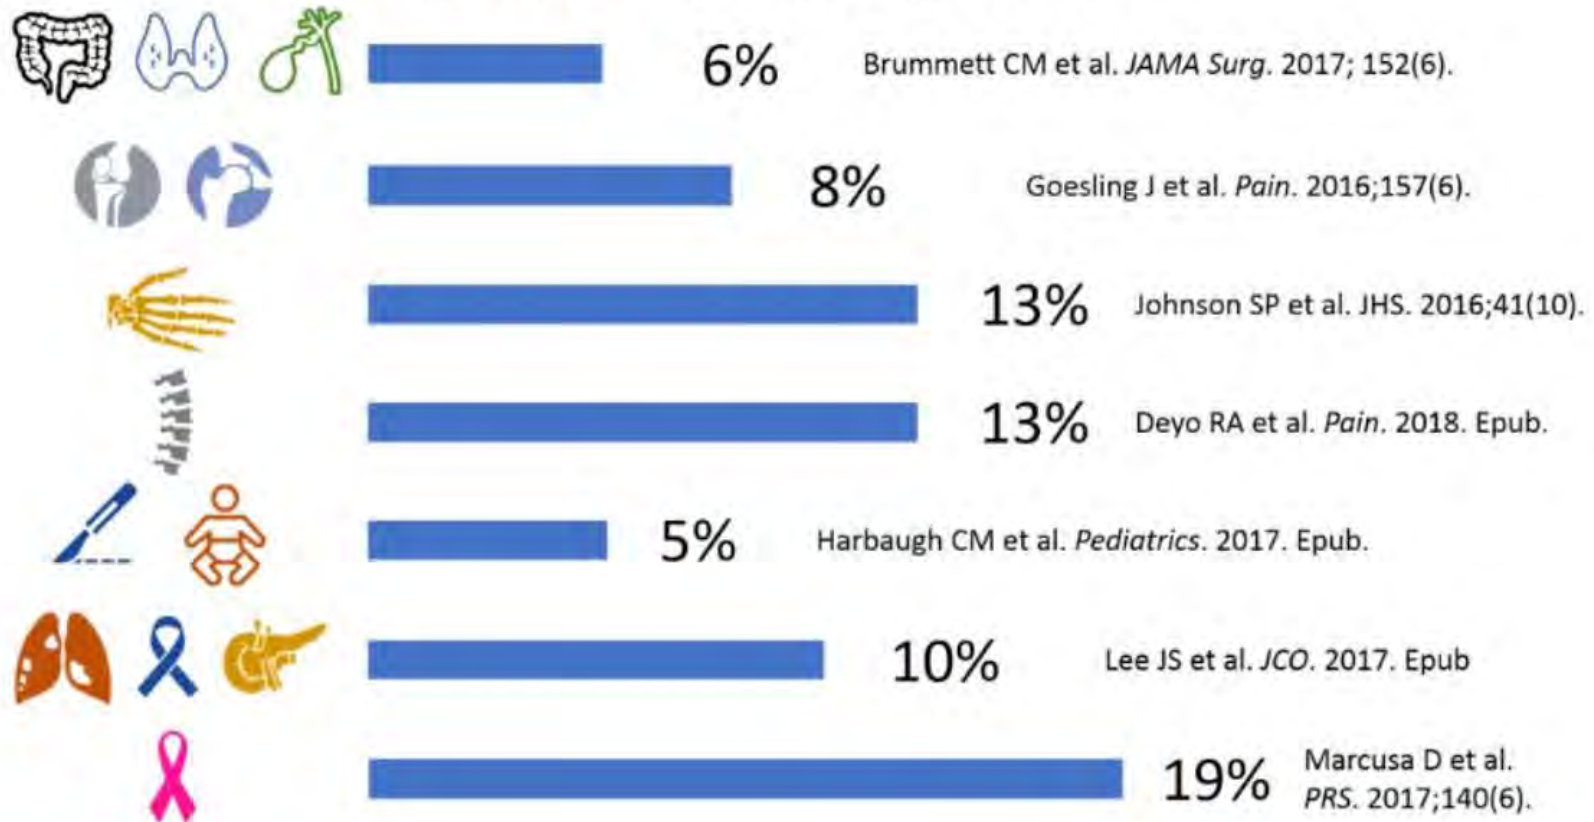

Risk factors: tobacco use, substance abuse disorders, mood disorders, anxiety, **preoperative pain**

Patient factors may significantly increase persistent use

Ask about preoperative pain!

JAMA Surg. 2017. 152(6) e170504.

New Persistent Opioid Use

Opioid dependence and surgical outcomes

Preoperative Opioid Use is Independently Associated With Increased Costs and Worse Outcomes After Major Abdominal Surgery

TABLE 3. Complication Rates by Preoperative Opioid Use

Complication	Opioid-naïve	Opioid Users	P
Infectious			
Surgical site infection: any	8.3% (159)	14.9% (75)	<0.001
Surgical site infection: superficial	5.8% (110)	10.4% (52)	0.001
Surgical site infection: deep	0.8% (15)	1.4% (7)	0.19
Surgical site infection: organ space	2.2% (41)	3.4% (17)	0.14
Pneumonia	0.9% (17)	2.0% (10)	0.053
Sepsis	1.6% (30)	3.8% (19)	0.004
Severe sepsis	1.2% (23)	1.4% (7)	0.66
<i>Clostridium difficile</i>	0.6% (11)	0.6% (3)	1
Respiratory			
Intraoperative unplanned intubation	0% (0)	0.2% (1)	0.21
Postoperative unplanned intubation	1.3% (24)	2.6% (13)	0.040
Pulmonary embolism	0.5% (9)	0.8% (4)	0.49
Cardiovascular			
Cardiac arrhythmia	0.4% (7)	0.8% (4)	0.26
Postoperative myocardial infarction	0.3% (5)	1.0% (5)	0.038
Postoperative cardiac arrest	0.2% (4)	0.2% (1)	1
Stroke			
Deep venous thrombosis	0.6% (12)	0.8% (4)	0.76
Postoperative transfusion	3.5% (66)	7.2% (36)	0.001
Renal			
Acute renal failure	0.7% (14)	1.4% (7)	0.18

Numbers are unadjusted and represent % (N).

Outcomes in Pain Care: contributing factors

 @DMDickersonMD

Summary

- Since CDC guidelines and opioid epidemic, less opioids prescribed, increasing overdoses occurring, prevalence of pain remains significant, pain more stigmatized
- Surgery may be a gateway for postoperative pain, patient factors are most influential (Vigilance, follow up)
- Preoperative opioid use increases adverse events and health care costs
- Whether managing chronic pain, weaning opioids, comprehensive pain care supports these scenarios, the patients, providers, and health system.
